

FREQUENTLY ASKED QUESTIONS

Will re-mapping invalidate my car's warranty?

The way we reprogramme a vehicle is completely undetectable. All codes and diagnostics that a dealer may read will remain exactly the same. We say it with confidence because of the rigorous testing regime all files go through, and we even give a 24 month software warranty to you.

Can the car be put back to its standard BHP?

Of course it can and we will offer this service free of charge. But we'll be very surprised if that's what you want after taking control of your vehicle's performance.

Should I tell my insurance company?

Whilst the upgrade is undetectable, the responsible answer to this question has to be "yes", your insurance company should be notified. However, many insurance companies do not penalise you for upgrades of this nature, particularly if you're tuning for increased economy.

Will my fuel consumption go up after an upgrade?

No, in fact quite the opposite. Even on a performance tune, if you continue to drive the car in the same way as you did before the upgrade, your fuel consumption will probably improve. Of course if you have a track map installed on the car and you are driving the car under the conditions with which a track map is intended you're likely to find a slightly reduced mpg figure. Economy tuning on the other hand, can have a dramatic effect on fuel consumption, with considerable improvements being achieved along with huge money savings on fuel.

FREQUENTLY ASKED QUESTIONS

Will the life span of my engine be reduced?

No, not at all. Sadly some engines can be over tuned, "stressing" the engine, transmission, cooling systems, etc, and reducing the life span and reliability of the car but we take great care to ensure that all of our modifications have no detrimental effect on your car. In a lot of cases the economy tune actually helps to extend the life of components such as the clutch and gearbox by making the delivery of the power far less aggressive and smoothing the overall drive of the vehicle.
